

My idea is a web app that helps me and my friends stick to our marathon training by making all of our workouts visible and competitive. It uses Strava's API and pulls in everyone's workouts (runs, bike rides, lifts, etc.) and turns it into dashboards where you can see your own progress and how you compare to your friends you're training with.

The problem it's solving is that Strava's great for logging runs, but it's not built for groups of people to be social and competitive. On Strava there is no sense of accountability for groups of people with similar goals. This app is meant to close that gap and add friendly competition to keep people accountable.

As for features, Strava OAuth login will be the most important. It will allow users to log in and sync activity data through webhooks. There will be individual dashboards for mileage and pace trends and a group dashboard so everyone can see each other's progress side by side. Additionally, there will be an optional race-day countdown for groups, a leaderboard for things like weekly mileage and longest runs, and charts to visualize progress over the training block. I want to start using the app just with my friend group as proof of concept and then I want to open it up so any group of runners can create their own group, invite people, and compete within that group.

On the tech side, I'm building the backend in FastAPI, with PostgreSQL for storage and SQLAlchemy for ORM. The frontend will be React with Recharts for the visualizations and Tailwind for styling. Strava API is the core data source and I'm planning to also use stravalib to find code that already exists. For hosting, I will probably use Render or Railway for the backend and Vercel for the frontend.

This app in the beginning will be for just me and my friends training for the same marathon, but the real audience is any group of runners who want more accountability than Strava alone gives them. The goal is to boost accountability and get people to run more consistently which in turn will help them achieve their goals.
