

Academic Planner

Project Summary

This project would be an interactive academic planning program designed to help students manage their classes, assignments, study time, and grades all in one place. Instead of using separate calendars, assignment lists, and grade calculators, students would have one application that connects all of these features. The ultimate goal is to make it easier for students to organize and understand what they need to accomplish.

Problem

Students often have to keep track of information across various platforms, such as class schedules, assignment due dates, grades, and personal calendars. This clusterness can cause students to overlook deadlines or lose track of how an assignment can affect a course grade. This program would bring all this information together and provide students with better sight of their academic workload and progress.

Major Features

This program would include an interactive weekly calendar where students can add their classes, assignments, appointments, and study sessions. Students would be able to drag and rearrange events. Assignments could be organized by course and include due dates, estimated completion times, priorities, and completion status. Larger projects could also be divided into smaller tasks.

Another major feature would be a grade calculator that allows students to enter their course grading categories and automatically calculate their current grade, as well as allowing students to enter hypothetical grades and see how they would affect their final course grade. The application would also calculate semester and cumulative GPA.

An academic dashboard would bring everything together by displaying upcoming assignments, current grades, upcoming classes, and other important information. One advanced feature could automatically recommend times for events based on assignment deadlines, estimated workloads, and the student's available free time.

Technologies

Technologies that can be used include React and TypeScript for the frontend and Java or Python with FastAPI for the backend. PostgreSQL can be used to store information such as users, courses, assignments, schedules, and grades. Git and GitHub would be used for version control and team collaboration. Additional third-party calendar and UI libraries may also be used to help create the interactive scheduling interface.

Intended Users

The intended users are college students who would be taking multiple courses and managing several assignments and deadlines at the same time. Students would benefit from having their schedules, assignments, and grades connected in one application rather than having to manage them separately.
